

# WHICH FACTORS AND LINKS ARE MENTIONED BY THE MOST SOURCES ?

| Factor <span>▲</span>    | # Citations <span>▲</span> | # Sources <span>▲</span> | In-Degree <span>▲</span> | Out-Degree <span>▲</span> | Outcomeness <span>▲</span> |
|--------------------------|----------------------------|--------------------------|--------------------------|---------------------------|----------------------------|
| <input type="text"/>     |                            |                          |                          |                           |                            |
| Farm production          | 46                         | 13                       | 24                       | 22                        | 0.522                      |
| Improved health          | 24                         | 17                       | 24                       | 0                         | 1.000                      |
| Increased knowledge; ... | 23                         | 11                       | 0                        | 23                        | 0.000                      |

The number of citations can be a useful measure of importance, but it can be distorted if one source mentions some factor a lot of times. A useful alternative is to count the number of *sources* that mentioned a factor or link at least once.
