

!Article type layout demo

📅 8 May 2026

This note lives in 991 !!! just my notes. It uses type: article (same effect as tags: paper): working-paper shell, serif body, no flower icon, and automatic ## / ### / blockquote styling. dual-column is also set so the main body is two columns on the web and in PDF-style layout; paper PDFs would add columns anyway, but this makes the HTML match.

What you should see on this page

This ## heading was plain in Markdown; the build added the blue banner-info style. The next line is a ### heading — it should get the soft rounded-info box.

Subsection (automatic rounded-info)

On article / paper pages, a normal blockquote like this one is turned into a note callout (not a tip).

Images when the page really has two columns

Without any extra attributes, an image should stay inside one column (narrow band), not span the whole content area.

`{.span-cols}` — use this when you want the figure to break out and span both columns:

`{.inline}` — keeps the image from being forced to full column width; handy for logos or small figures inside text.

`{width=...}` — passed through as the HTML width attribute (simple sizes):

`{style="..."}` — full CSS control (units, max-width, etc.):

Section-only two columns `{.two-col}`

This heading has `{.two-col}` in the source. Content below runs in **two columns until the next heading**, even on a page that already uses page-level columns (use sparingly — it is easy to get a “columns inside columns” look).

Left column text: Lorem ipsum dolor sit amet.

Right column text: Consectetur adipiscing elit.

Done

That covers **article-type defaults, page-level two columns, `{.span-cols}`, `{.inline}`, `width=`, `style=`, and a `{.two-col}` segment.**
