How CausalMap Works

1. **Create Projects**: Create a project and upload PDF or docx documents into it as source material for analysis (we call each document a "source"). You can have multiple projects, and each project usually contains multiple sources.
    - See Projects Panel and Upload Documents.
2. **Create Causal Links manually**: Identify and highlight causal claims within the source text; each highlight becomes a new causal link. After you have created multiple links you can view them as a causal map.
    - Use the Create Links tab and view results in the Map panel.
3. **Create Causal Links using AI**
    - See AI coding.
4. **Filter & Analyze**: Apply filters to your causal links focus on specific aspects of your data
    - Use the Analysis Filters: Do qualitative causal analyseis on the selected links by filtering manipulate those links.
    - Explore Map, Factors, Links, and Pivot Tables.
5. **Collaborate**: Work together live with multiple users
    - Manage sharing in Sharing and Permissions.
