

WHAT ARE THE NARRATIVES BEHIND A SPECIFIC LINK ?

📅 22 Oct 2025

It is important to frequently return to the original quotes associated with each factor or link to **understand how different stakeholders interpret and talk about key concepts**. This can be done in Causal Map by clicking on a link in the interactive map, or by printing out quotes for a particular filter (e.g. just for a single bundle of links) with additional context and metadata.

Cause: Barber Shop

Effect: Social Connection

Um, so, I put the barber shop. Um, it's **where I feel most socially connected** ...and that's because, I think, the regularity of how often we met up there, there's a kind of community spirit, a lot of people that attend there to get their haircut are from the local area, or barbers are from quite local areas as well and they've been there for so long. So, some of the barbers may have been cutting my hair for when I was like 5 years old. There's a real like, they just know me from childhood to a man, kind of thing. A lot of my peers have had that experience with the barber shop, so, kind of, just, when you go, when we're there, we're just, maybe talking about, it could be football, it could be the news, it could be music, it could be lots of different things, but there's always a shared interest and there's always humour, comedy you know, just jokes, um, because it's so regular and everyone needs a haircut every couple

Print View

The purpose Print View is to make it easy to explore and read actual quotes from the currently filtered links. What it does is show, instead of the contents of the Tabulator table, a printed version of the same information, leaving the table headers and filters in place. The toggle switches between table contents view and print view.

This view prints out the quotes from each row in the table, grouped by the Group By columns formatted as nested headings, and we suppress repeated headings until they change.

We also reveal two more toggles:

- **Show Details:** Print the values of all the extra columns such as tags and any [Custom Columns](#)
- **Context:** for each quote we add an additional three sentences at each side, highlighting the actual quotes.
- **PDF:** prints the **full** list (not just the current on-screen page) in a new tab. Use **Print** → **Save as PDF**. The export uses slightly **smaller** body type. Each **group** from **Group by** is a separate table so the **group title repeats at the top of each printed sheet** when one group spans many pages. The new tab's **title** (and the usual default **Save as PDF** name in **Chrome** / **Edge**) is **CausalMap-Links-<project>-<YYYY-MM-DD-HHmm>**. In **Chrome 131+** and current **Edge**, the **bottom page margin** lists the **current project name, date/time, Causal Map | causalmap.app**, and **page i / n**. If the system print dialog also adds its own header/footer, turn that off there to avoid duplicates.

You can manually sort the texts using to the sorting widgets in the tabulator headers, as far as allowed by the nested headers.
